MND FACTS

Motor neurone disease (MND) is a progressive, degenerative disease that attacks the nerves that support movement, speech, swallowing, and breathing.

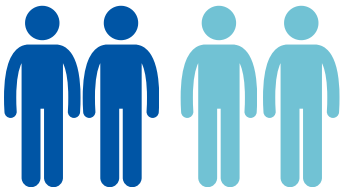

The majority of people with MND will lose the ability to use their voice.

There is currently no known cause, treatment, or cure. In 90-95% of cases of MND, the cause is unknown.

The average life expectancy after diagnosis is 27 months.

Every day, 2 Australians are diagnosed with MND, and every day 2 Australians lose their lives to MND.

Every MND journey is different. The progress, severity and symptoms of MND are different for everyone.

MND Tasmania has provided specialised support services for the past 40 years to those impacted by MND. Until there's a cure, there's care.
